## 13 Supporting Information Text

### 14 Materials and Methods

15 We draw on two data sets (the Gallup Panel COVID-19 and the U.S. Census Household Pulse Survey) to investigate the  
16 emotional and mental health impact of Floyd’s murder across individuals in the U.S. by race, age, gender, income, education,  
17 and geographical location. We also draw on the Gallup-Sharecare Well-Being Index data set for historical context. They are  
18 described below together with the analytic steps we applied to them.

19 In this supplement, we provide additional information and diagnostics: For the Gallup Panel COVID-19 sample, we provide  
20 descriptive statistics, daily time series of anger and sadness levels, full  $p$ -values reported in **Fig. 1** (including for additional  
21 socioeconomic categories) and **Fig. 3**, and additional statistics about changes in anger and sadness pre-Floyd and post-Floyd.  
22 We also show weekly time series for the demographic and economic subgroups.

23 For the U.S. Census Household Pulse Survey data, we report descriptives, full effect sizes (Cohen’s  $d$ ) for anxiety and  
24 depression following Floyd’s death in Minnesota and the rest of the USA, and the full  $p$ -values reported in **Fig. 2** and **Fig. 3**.

25 For the Gallup-Sharecare Well-Being Index we report descriptives, and show weekly anger and sadness time series and  
26 histograms.

27 **Gallup Panel COVID-19.** We obtained 117,568 responses from  $N = 47,355$  respondents between March 24, 2020 and August 16,  
28 2020. We focused on anger and sadness, as obtained as the response to the question “Did you experience the following feelings  
29 during a lot of the day yesterday?” with prompts including anger and sadness, requiring a binary (yes/no) response option.  
30 For simplicity, we did not use the fact that we had multiple responses from some respondents in the analytic strategy. Sample  
31 demographics are provided in Table S1.

32 **Weighting.** The obtained samples were weighted by Gallup to correct for non-response. Non-response adjustments were made by  
33 adjusting for gender, age, race, Hispanic ethnicity, education and region. Demographic weighting targets were based on the  
34 most recent population survey figures for the U.S. population aged 18 and older (1).

35 Regarding the line plot in **Fig. 1 a, b** showing weekly percentage of the respondents reporting having experienced anger  
36 and sadness respectively, the Gallup survey data was weighted following differing schemes: prior to April 27, responses are  
37 weighted at the daily level; after this date, responses are weighted at the weekly level. For the overall timeseries plots, we  
38 therefore weighted pre-April 27 data at the daily level to calculate proportions, and then took the unweighted mean across  
39 days to produce week-level estimates. Beginning April 27, proportions were calculated using weights directly at the week level.  
40 Percentages and error bars (indicating standard errors) are weighted estimates derived through post-stratification on gender,  
41 age, race, Hispanic ethnicity, education and region. Histograms on the right show associated distributions of weeks, the arrows  
42 point to the week after Floyd’s death and are labeled with standard deviations across all 2020 weeks ( $z$ -scores). Regarding **Fig.**  
43 **1 c, d**, following Gallup’s guidelines, we applied their weights only to overall data (leftmost arrow) but did not apply them in  
44 subgroup analyses.

45 **Floyd week vs. Baseline Determination.** For the Gallup Panel COVID-19, the 4 weeks prior to Floyd’s death were used as a baseline  
46 for calculating changes in anger and sadness, from April 27 to May 24. This baseline was compared against the week of June 1  
47 to June 7, which was the first full week following Floyd’s death. We did not include the week of May 25, when news of Floyd’s  
48 death was still spreading, and for which the anger and sadness levels show intermediate values (see Fig. 1) and Fig. S1). We  
49 therefore have two time periods: the 4-week baseline period and the George Floyd week. For each of these time periods, we  
50 calculated proportions of individuals feeling anger and sadness (**Fig. 1 c, d**).

51 **Statistical Analyses.** In **Fig. 1 c, d**, our goal was to establish whether the change in anger or sadness for one demographic  
52 category was significantly larger than that of another demographic category. We made pairwise comparisons between mutually  
53 exclusive categories only, e.g., we compared White-only to Black-only Americans. **Fig. 1 c** and **d** shows increases of anger  
54 and sadness experienced by different racial, gender, age and political groups in the week after Floyd’s death compared to the  
55 four preceding baseline weeks; shaded boxes indicate standard errors (SEs). Gallup did not provide weights suitable for the  
56 subgroup analysis in **Fig. 1 c** and **d**; they are unweighted means and SEs. See Fig. S2 for the full  $p$ -values reported in Fig. 1,  
57 and for additional socioeconomic categories.

58 For each pair, a bootstrap test was used to establish significance. We took  $B = 10,000$  bootstrap samples for each of the  
59 categories; for each sample, we calculated the change in anger or sadness and subtracted it from the other category’s change.  
60 Our  $p$ -value is the percentage of samples with a difference greater than the observed difference. Descriptive statistics on changes  
61 in anger and sadness pre-Floyd and post-Floyd are shown in Table S2.

62 To see the time series of anger and sadness rates at the daily level, see Fig. S1. To see weekly time series for the demographic  
63 and economic subgroups, please refer to Figs. S3, S4, S5, S6, S7, S8.

64 **Physical Proximity.** Gallup provided county-level FIPS codes for respondents, from which county and state of residence could  
65 be determined. For **Fig. 3 a**, we calculated three proportions to measure change in sadness and anger reported in the  
66 week following Floyd’s death compared to the previous four weeks across respondents within: a) Hennepin County (where  
67 Minneapolis is located), b) Minnesota, and c) all other US respondents. These proportions were unweighted. See Table S3 and  
68 Fig. S10 for the full  $p$ -values reported in **Fig. 3**.

69 **U.S. Census Household Pulse Survey.** From the U.S. Census Household Pulse Survey we obtained symptoms of anxiety and  
70 depression from April 23 to June 2, 2020 across 409,652 responses from  $N = 319,471$  respondents (2). For this number of  
71 respondents both PHQ and GAD responses were available. (We included a small number of additional responses ( $< 1,000$ )  
72 from respondents who were missing one of the responses to obtain the average of the other), see Table S4). Anxiety was  
73 measured using the Generalized Anxiety Disorder 2-item (GAD-2) instrument and depression was measured using the Patient  
74 Health Questionnaire-2 (PHQ-2). Descriptive statistics of the sample are shown in Table S4. For simplicity, we did not use the  
75 fact that we had multiple responses from some respondents in the analytic strategy.

76 **Weighting.** Depression and anxiety symptom severity and percentages were calculated using a weighted mean across respondents  
77 for the baseline and Floyd groups, separately, using the respondent-level weights provided with the survey. Estimates incorporate  
78 Census-provided weights for age, gender, education, race and non-response.

79 **Floyd week vs. Baseline Calculation.** Each week of data collected for the Household Pulse Survey contains six days of data, with  
80 one day gaps between collection periods. Data for the baseline weeks before Floyd’s death was obtained as responses from  
81 April 23 to May 26, which we compared to the period following Floyd’s death, May 28 to June 2. We included 5 weeks in the  
82 baseline period as the Census reported the first two weeks cumulatively.

83 **Statistical Analyses.** In Fig. 2 and Fig. 3, b) we calculated increases in anxiety and depression as standardized effect sizes  
84 (Cohen’s  $d$ ) comparing the five weeks before Floyd’s death (April 23 to May 26) to the week following Floyd’s death (May 28 to  
85 June 2) using data from the Census Household Pulse survey (see Table S5 and Table S6). We used the sum of the person-level  
86 item scores to estimate total symptom severity for the PHQ-2 and GAD-2 scales.

87 Significance tests of effect sizes are calculated based on a weighted  $t$ -test between the baseline and Floyd week; significance  
88 between effect sizes across racial groups are based on a  $z$ -test as described below. To compare Cohen’s  $d$  values, we first calculate  
89 the sampling variance for each  $d$ :  $var(d_i) = \frac{1}{n_1} + \frac{1}{n_2} + \frac{d_i^2}{2(n_1+n_2)}$ . We then calculate  $z$  as follows:  $z = \frac{d_1-d_2}{\sqrt{var(d_1)+var(d_2)}}$  and  
90 report the associated  $p$ -value (3). See Fig. S9 for the full  $p$ -values reported in Fig. 2.

91 **Physical Proximity.** The Household Pulse data provided state of residence for each response. We calculated symptom severity for  
92 Minnesota responses separately from all other states to investigate the role of proximity and reported differences in anxiety and  
93 depression in Fig. 3 b), analogous to Fig. 2. Effect sizes (Cohen’s  $d$ ) for anxiety and depression following Floyd’s death in  
94 Minnesota and the rest of the USA are shown in Table S7; see Table S8 for proportions with GAD-2 and PHQ-2 scores  $> 2$ .  
95 See Fig. S10 for the full  $p$ -values reported in Fig. 3.

96 **Additional depression burden among Black Americans.** As seen in Table S6, in the baseline period, 22.46% White-only Americans  
97 and 26.67% Black-only Americans screened positive for depression using a customary threshold score of 3 or higher on the  
98 PHQ-2 (4). In the week after Floyd’s death, this increased to 23.66% and 29.91% among White and Black Americans  
99 respectively. While the rates of positive screening increased for both, Black Americans screened positive at a rate that was  
100 2.0539% ( $\Delta_{MH}$ ) higher compared to White Americans.

101 The US Census reports that 13.4% of 328,239,523 = 43,984,096 Americans are Black (5) (*BlackAmericanPopulationUS*).  
102 Thus, the 2.0539 % increased positive screen rate for depression would correspond to an additional 903,389 ( $\Delta_{MH} *$   
103 *BlackAmericanPopulationUS*) positive screens for depression among Black Americans.

104 The PHQ-2 questions in the US Census Household Pulse Survey asked the respondents about their symptoms “Over the  
105 last 7 days” with answer choices “Not at all” (0 points), “Several days” (1 point), “More than half the days” (2 points) and  
106 “Nearly every day” (3 points). Assuming thus that a positive screen for depression is associated with depressive symptoms for 3  
107 to 7 days, the 903,389 additional positive depression screens in Black Americans correspond to between 2.710 and 6.324 million  
108 mentally unhealthy days.

109 **Gallup-Sharecare Well-Being Index.** Historical emotional responses, anger, from January 2, 2009 to January 4, 2017, and  
110 sadness, from January 2, 2009 to December 20, 2016, were obtained from Gallup-Sharecare Well-Being Survey. Data on anger  
111 responses was not available for the years 2014 and 2015. We focused on anger and sadness, obtained as the response to the  
112 questions: “Did you experience the following feelings during a lot of the day yesterday?” with answer choices including anger  
113 and sadness, with a binary (yes/no) response option. Descriptive statistics of the sample are shown in Table S9.

114 **Weighting.** Gallup weights the data daily to compensate for unequal selection probabilities and non-response. In addition, Gallup  
115 weights the data to match targets from the U.S. Census by age, sex, region, gender, education, ethnicity, and race, as well as  
116 population density of self-reported location.

117 Fig. S11 shows weekly aggregate of anger (top) and sadness (bottom). Error bars (indicating standard errors) are Gallup-  
118 weighted estimates derived through post-stratification on gender, age, race, Hispanic ethnicity, education and region. Fig. S12  
119 shows histograms of weekly distribution of mean anger (top) and sadness (bottom).

120 **Data Sharing.** The Gallup Panel COVID-19 data and the historical Gallup Gallup-Sharecare Well-Being Index are available  
121 from the Gallup organization; we are not allowed to share it. The US Census Household Pulse Survey data is available from the  
122 US Census (2). We also share the weekly aggregated data in the OSF repository associated with this project (<https://osf.io/ytsae/>),  
123 together with our analysis code (R scripts).

124 .

**Table S1. Gallup Panel COVID-19 data set: Demographic characteristics (unweighted).**

	N	% Angry (SE)	% Sad (SE)
<b>Total Participants</b>	47,355	23.7% (0.13%)	29.3% (0.14%)
<b>Race</b>			
White (non-Hispanic)	41,293	23.4% (0.14%)	29.0% (0.15%)
Hispanic	2,461	26.3% (0.62%)	32.8% (0.66%)
Black	2,228	25.0% (0.65%)	29.7% (0.69%)
Asian	800	25.6% (1.20%)	33.6% (1.18%)
Other	495	27.1% (1.38%)	30.6% (1.43%)
Refused	78	31.9% (3.61%)	30.7% (3.57%)
<b>Gender</b>			
Male	25,252	23.3% (0.18%)	24.1% (0.18%)
Female	22,101	24.1% (0.20%)	35.2% (0.22%)
Other	2	0% (0%)	0% (0%)
<b>Age</b>			
18–30	2,035	26.2% (0.72%)	36.2% (0.78%)
31–45	8,454	26.3% (0.34%)	29.7% (0.35%)
46+	36,866	23.0% (0.15%)	28.9% (0.16%)
<b>Education</b>			
High School, Vocational School, or Less	6,188	24.2% (0.37%)	28.8% (0.39%)
Some College or College Graduate	14,375	24.4% (0.25%)	29.7% (0.26%)
Postgraduate Degree or Work	11,196	24.1% (0.28%)	28.6% (0.29%)
Refused	15,596	22.6% (0.23%)	29.7% (0.25%)
<b>Income</b>			
\$0–\$59,999	12,901	25.4% (0.26%)	34.6% (0.28%)
\$60,000–\$119,999	16,719	23.2% (0.22%)	27.9% (0.23%)
\$120,000+	13,886	22.6% (0.24%)	26.2% (0.25%)
Refused	3,849	24.4% (0.57%)	29.4% (0.61%)
<b>Political party</b>			
Democrat	20,656	28.1% (0.22%)	36.3% (0.23%)
Republican	14,072	23.2% (0.26%)	28.1% (0.28%)
Other/Refused	17,153	18.5% (0.21%)	21.5% (0.22%)

**Table S2. Gallup Panel COVID-19 data set: Percentage of each demographic group experiencing anger or sadness before and immediately after Floyd's death. The top row uses Gallup-provided weights (corresponding to Fig. 1 A, B and the overall arrow in Fig. 1 C, D); all other rows are unweighted percentages. Also included: standard errors, the percent change in anger or sadness,  $z$  statistics for the difference in proportion with corresponding  $p$ -value, and  $N$ s. When computing the  $z$  statistic and associated  $p$ -value for the top (weighted) row, we used weighted proportions but the same  $N$ s as in the unweighted case.**

	Anger					Sadness					N Pre-Floyd	N Floyd
	% Pre-Floyd (SE)	% Floyd (SE)	Change	$z$	$p$	% Pre-Floyd (SE)	% Floyd (SE)	Change	$z$	$p$		
<b>Overall (weighted)</b>	24.0% (0.33%)	38.4% (0.82%)	14.4%	18.0	<0.001	28.9% (0.35%)	38.1% (0.80%)	9.20%	11.1	<0.001	16,681	3,760

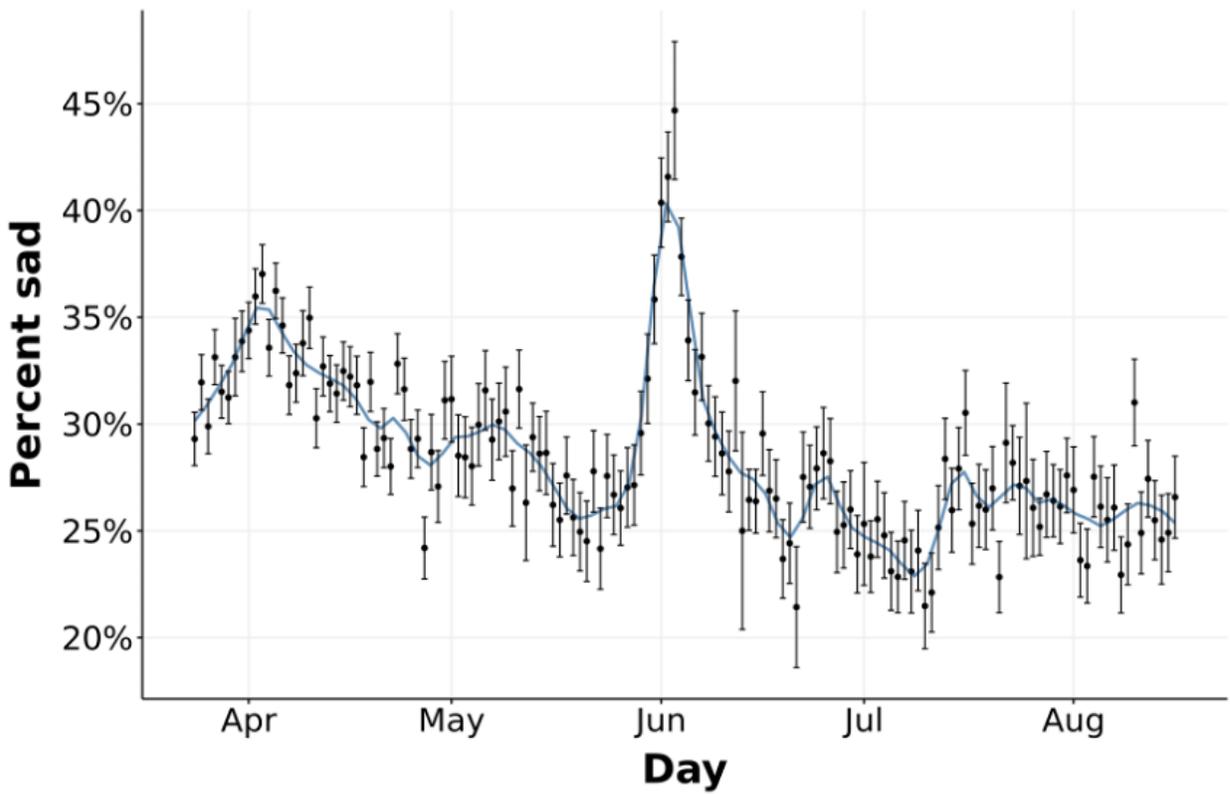

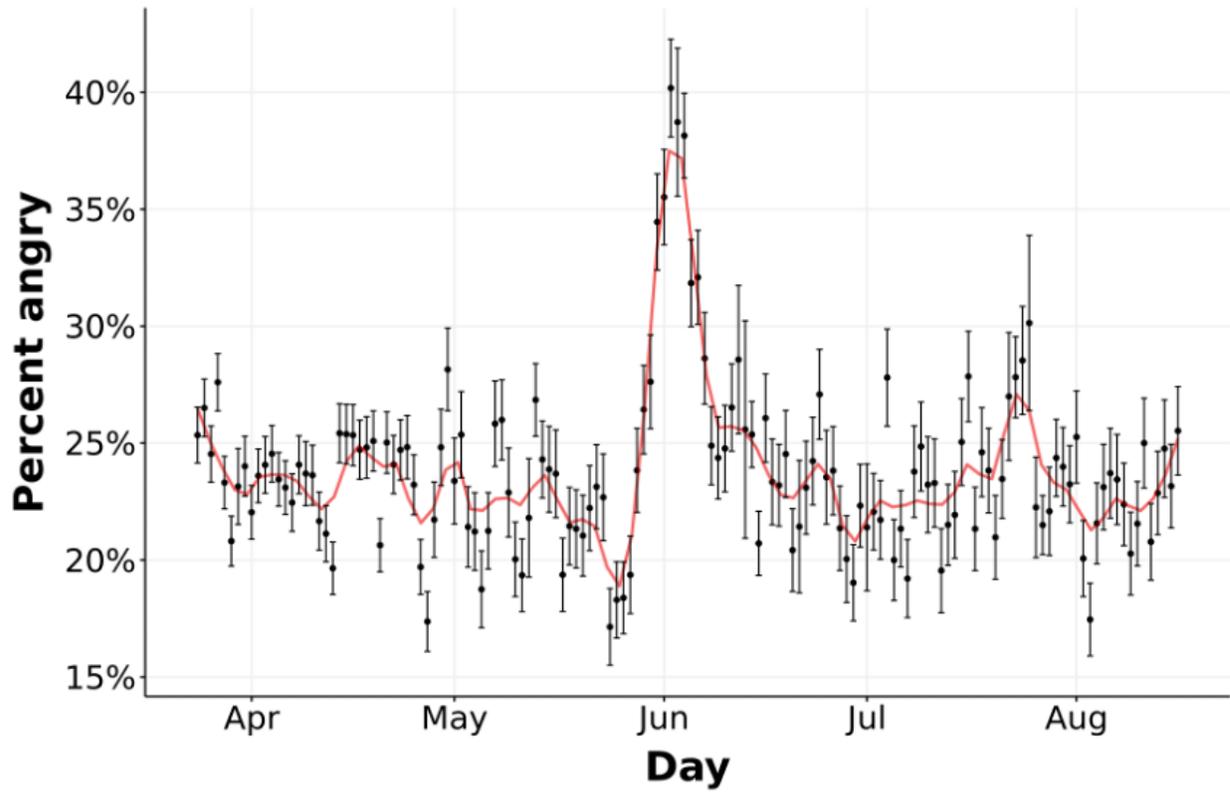

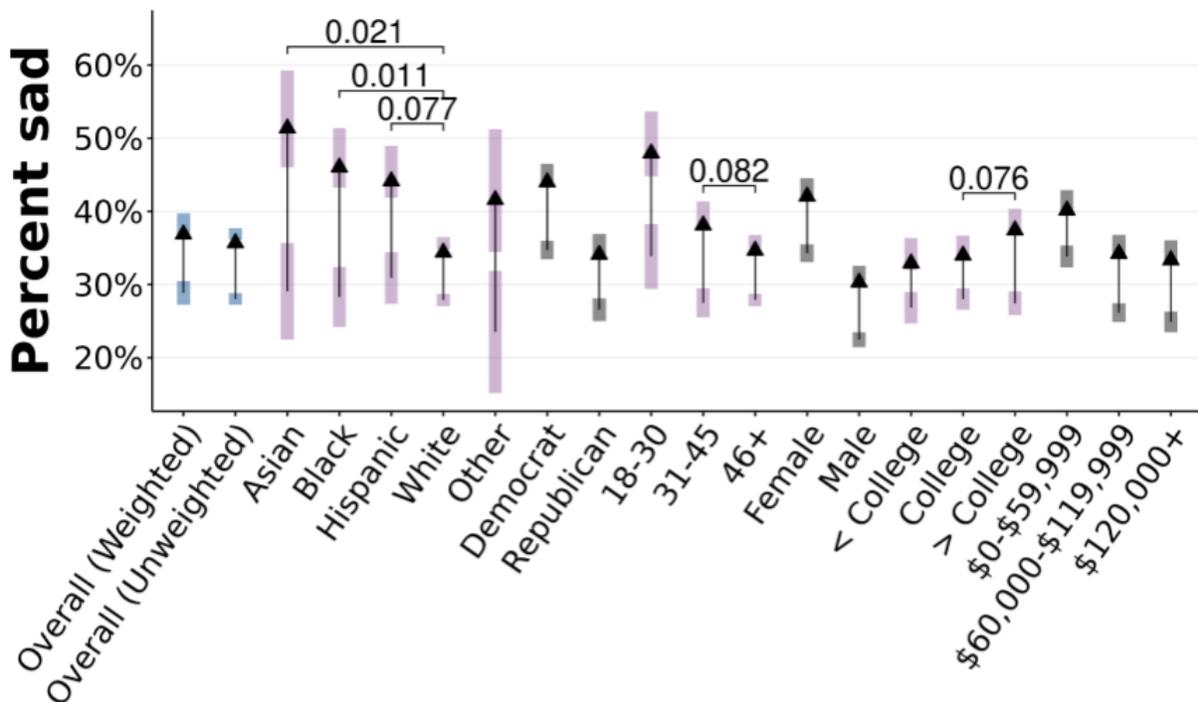

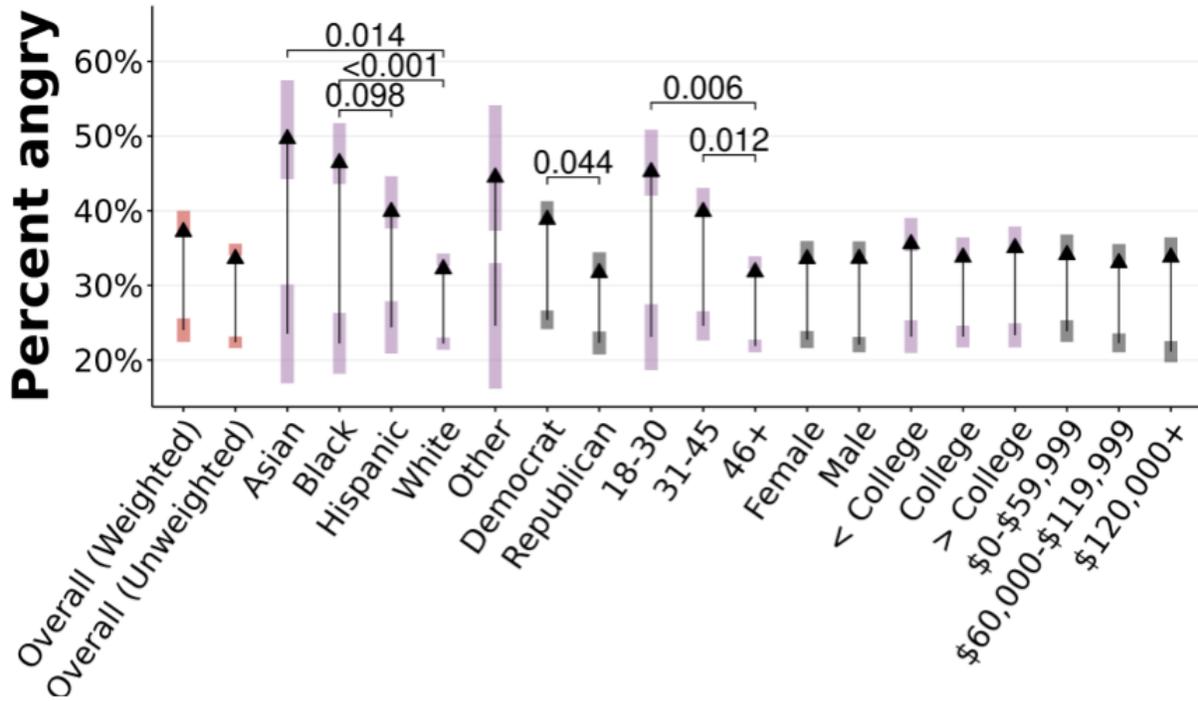

Fig. S1. Gallup Panel COVID-19 data set: (Top) Daily percentage of the respondents reporting having experienced anger and (Bottom) sadness 'a lot of the day yesterday'. Percentages and error bars (showing SEs) are unweighted since Gallup's weights applied only to weekly periods for much of the time shown.

**Fig. S2.** Gallup Panel COVID-19 data set: Increases in anger (**Top**) and sadness (**Bottom**) experienced by race, political party, age, gender, education and income in the week after Floyd's death compared to the four preceding baseline weeks; shaded boxes indicate SEs. Gallup did not provide weights suitable for the subgroup analysis; they are unweighted means and SEs. Between-bar significances are calculated as the proportion of bootstrapped samples with a greater difference than that observed.

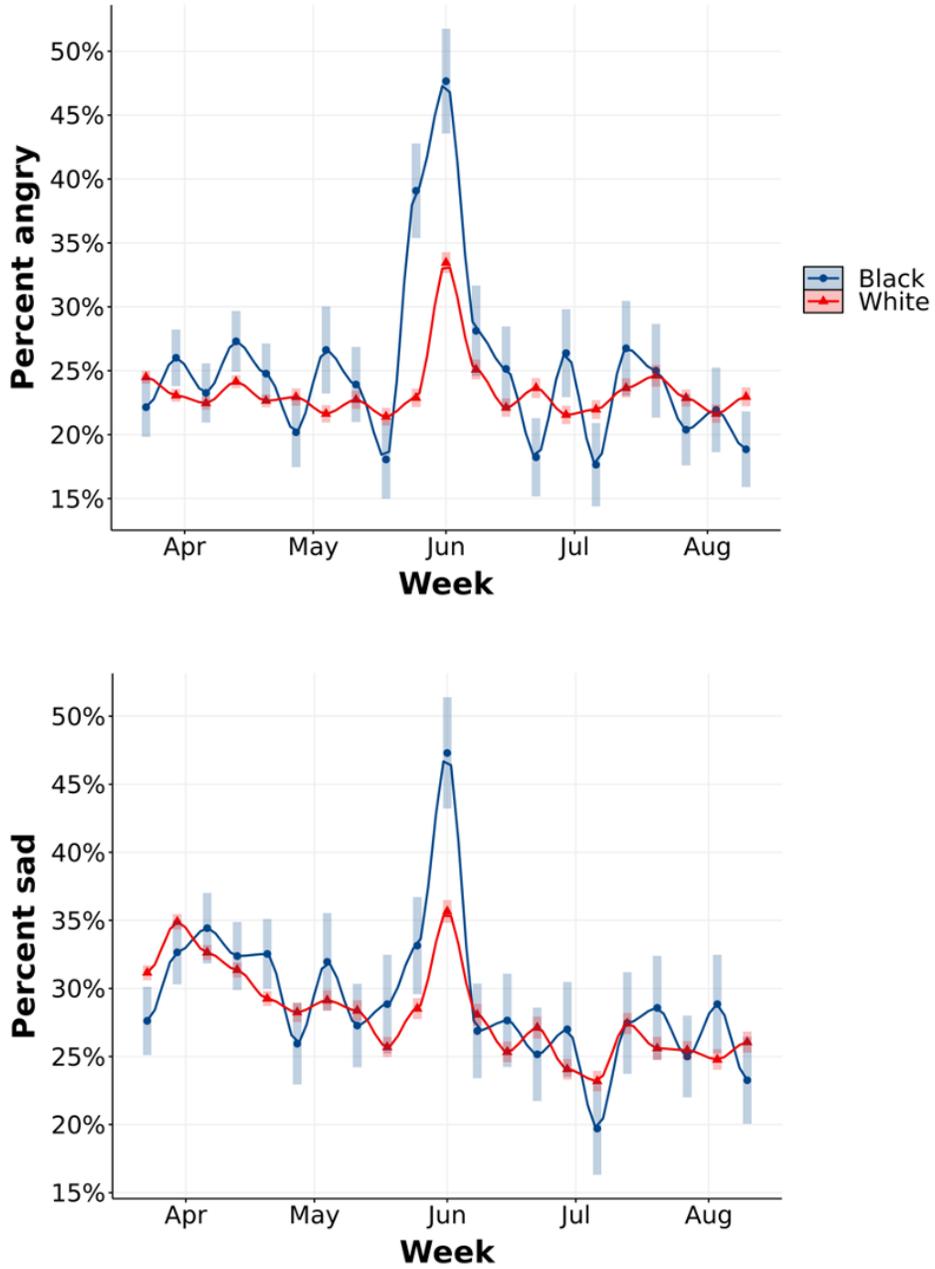

Fig. S3. Gallup Panel COVID-19 data set: (Top) Weekly percentage of Black Americans and White Americans reporting having experienced anger and (Bottom) sadness 'a lot of the day yesterday.' Percentages and error bars (indicating standard errors) are unweighted estimates.

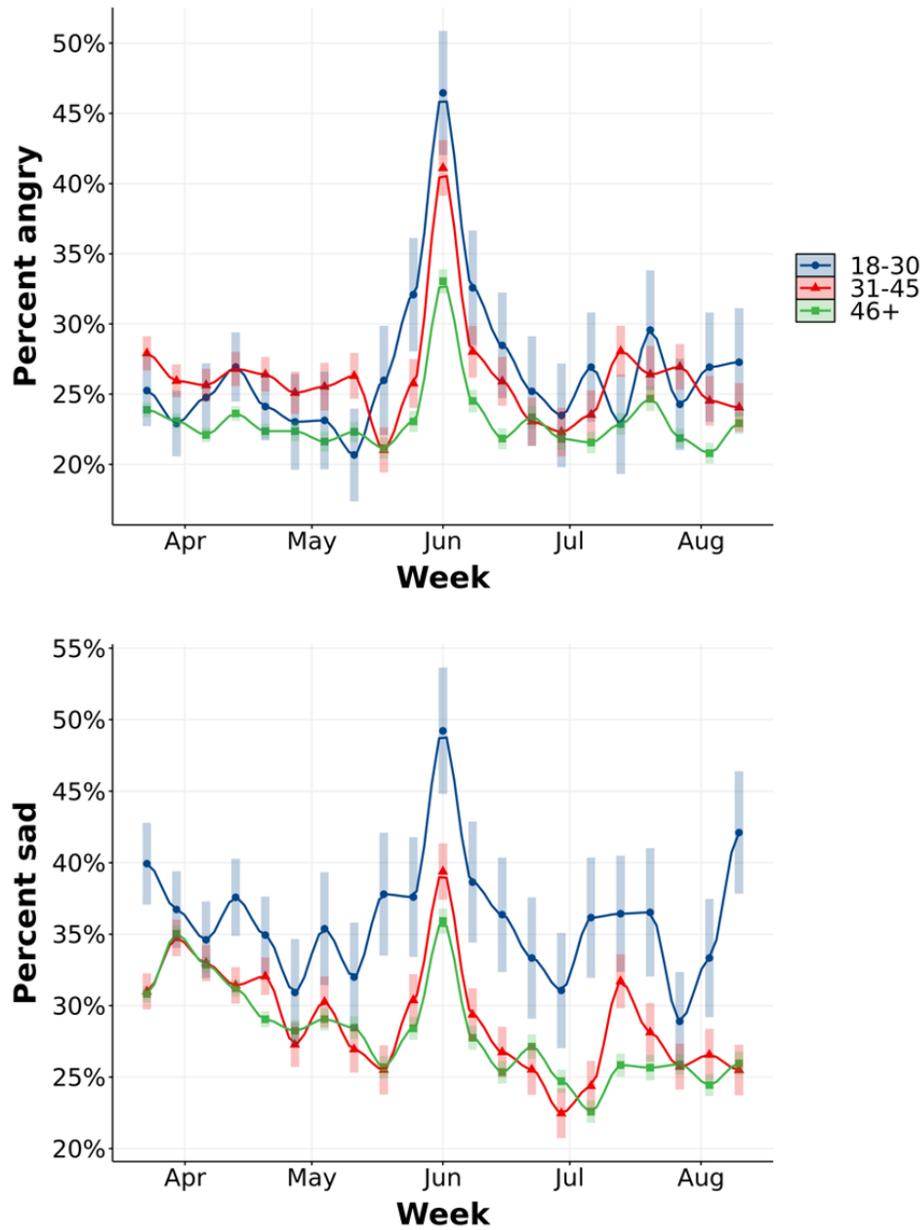

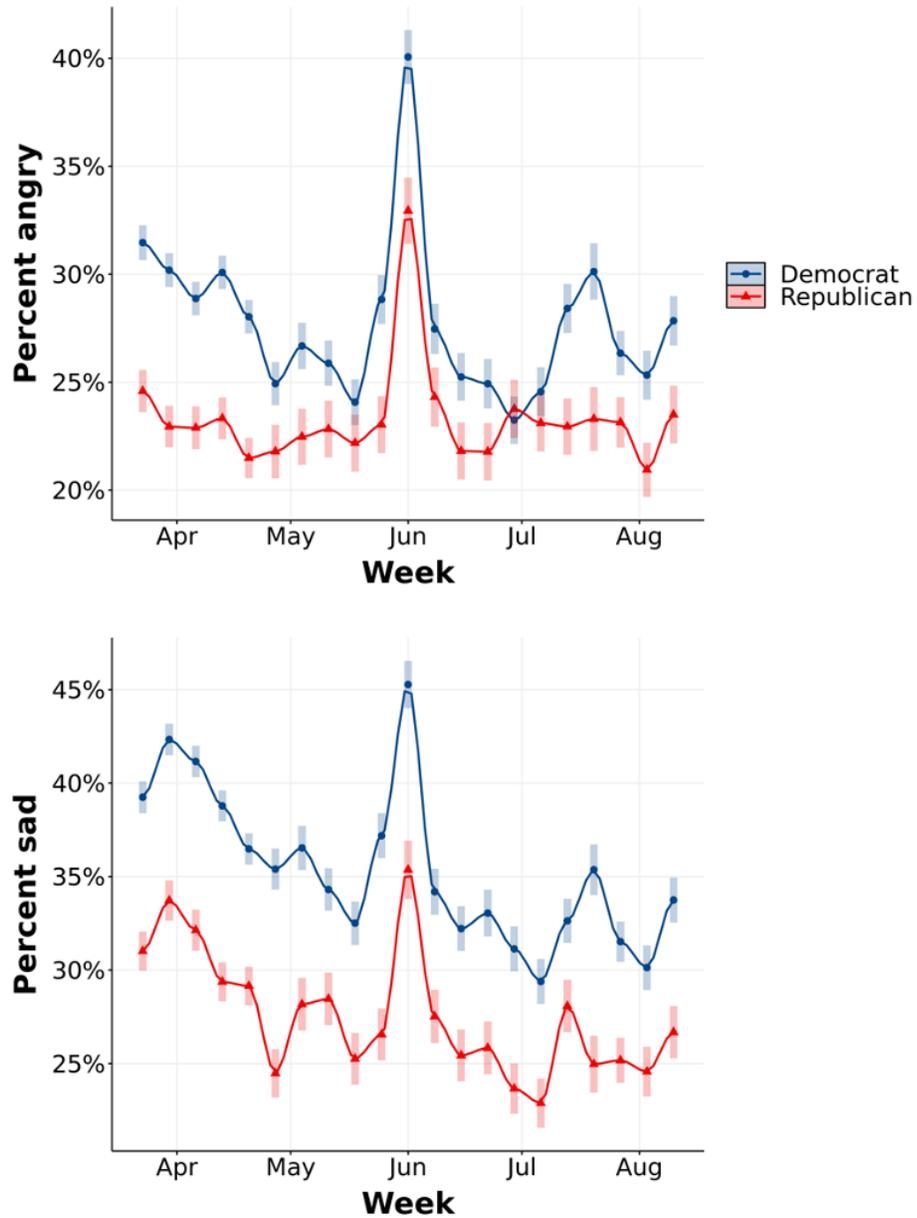

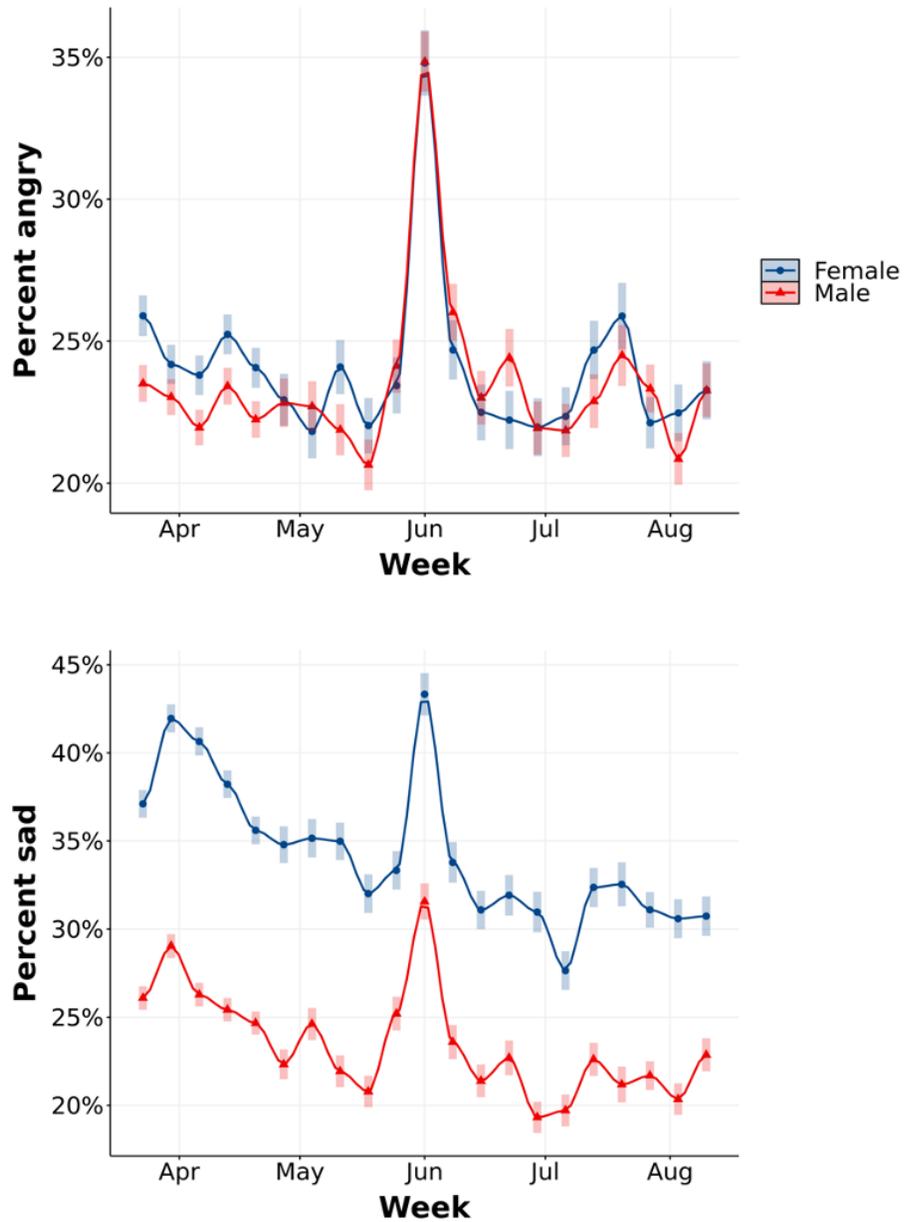

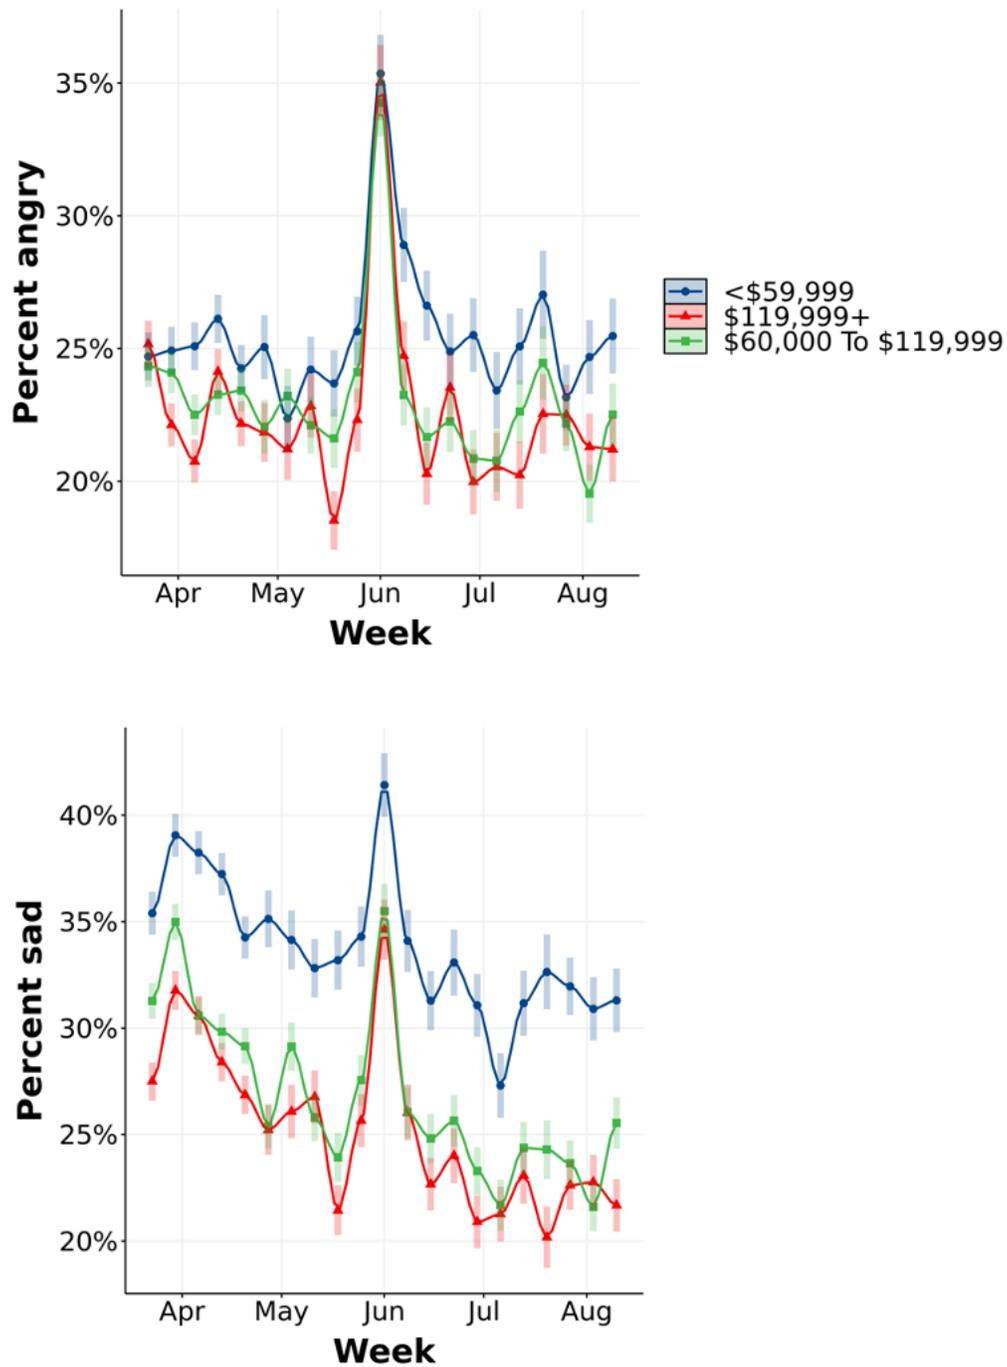

Fig. S4. Gallup Panel COVID-19 data set: (Top) Weekly percentage of respondents broken down by age reporting having experienced anger and (Bottom) sadness 'a lot of the day yesterday' in the representative 2020 Gallup Panel COVID-19 survey. Percentages and error bars (indicating standard errors) are unweighted estimates.

**Fig. S5.** Gallup Panel COVID-19 data set: (Top) Weekly percentage of self-identified Democrat and Republican respondents having experienced anger and (Bottom) sadness 'a lot of the day yesterday' in the representative 2020 Gallup Panel COVID-19 survey. Percentages and error bars (indicating standard errors) are unweighted estimates.

**Fig. S6.** Gallup Panel COVID-19 data set: **(Top)** Weekly percentage of self-identified Male and Female respondents having experienced anger and **(Bottom)** sadness 'a lot of the day yesterday' in the representative 2020 Gallup Panel COVID-19 survey. Percentages and error bars (indicating standard errors) are unweighted estimates.

**Fig. S7.** Gallup Panel COVID-19 data set: (**Top**) Weekly percentage of respondents broken down by yearly income having experienced anger and (**Bottom**) sadness 'a lot of the day yesterday' in the representative 2020 Gallup Panel COVID-19 survey. Percentages and error bars (indicating standard errors) are unweighted estimates.

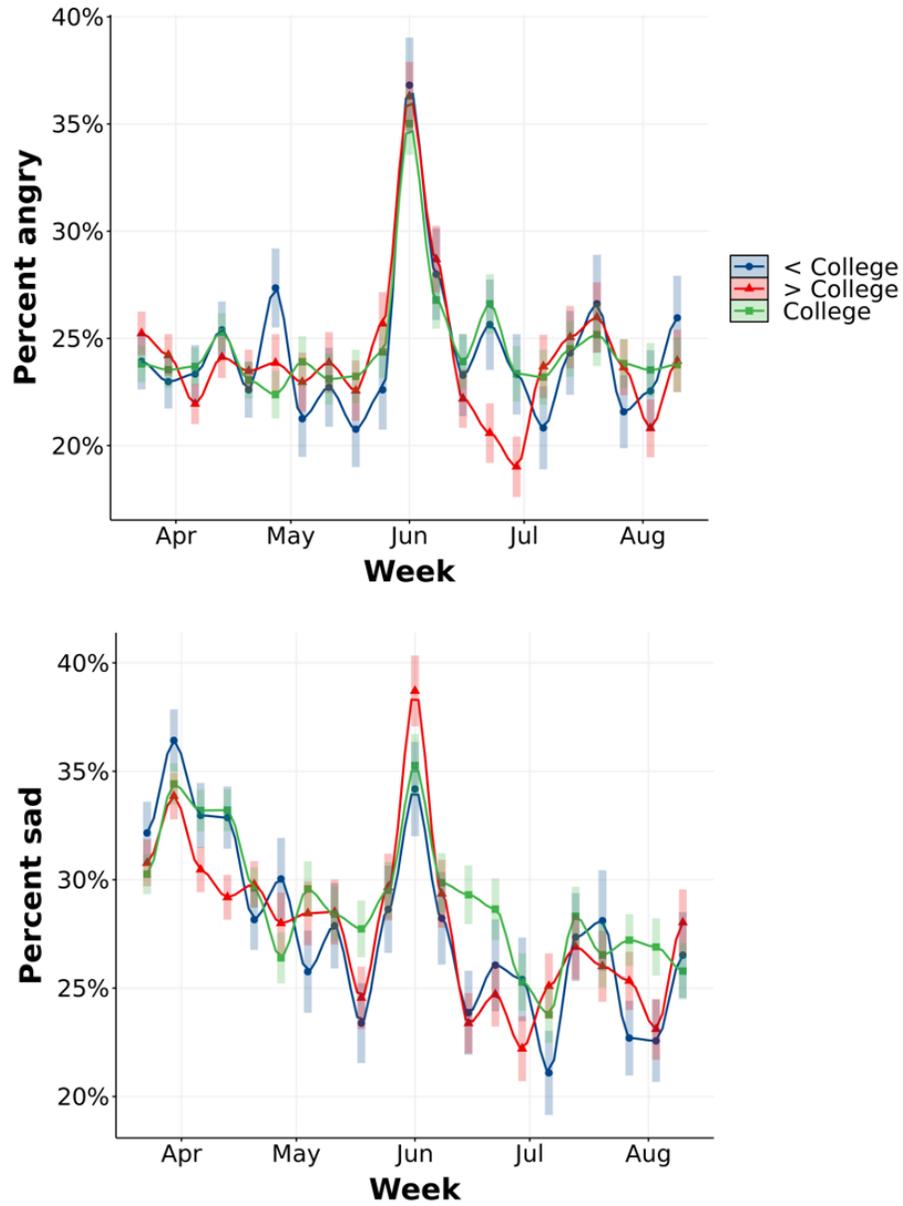

Fig. S8. Gallup Panel COVID-19 data set: (Top) Weekly percentage of respondents broken down by education level having experienced anger and (Bottom) sadness 'a lot of the day yesterday' in the representative 2020 Gallup Panel COVID-19 survey. Percentages and error bars (indicating standard errors) are unweighted estimates.

Table S4. U.S. Census Household Pulse Survey: Demographic characteristics of survey respondents for data collected between April 23 to June 2, 2020. Estimates incorporate Census-provided weights for gender, age, race, and education and non-response. Also shown are mean GAD-2, mean PHQ-2, % anxious, and % depressed along with SEs in the sample. GAD-2 and PHQ-2 range from 0–6 and anyone scoring >2 SEs in the sample. GAD-2 and PHQ-2 range from 0–6 and anyone scoring >2 on GAD-2 and PHQ-2 were identified as anxious and depressed respectively. Total N for which both GAD and PHQ were available is 319,471, as reported in manuscript.

**Fig. S9.** U.S. Census Household Pulse Survey: Increases in anxiety and depression as standardized effect sizes (Cohen's *d*'s) comparing the five weeks before Floyd's death (April 23 to May 26) to the week following Floyd's death (May 28 to June 2) using data from the Census Household Pulse survey. Depression was measured using the Patient Health Questionnaire (PHQ-2), anxiety using the Generalized Anxiety Disorder (GAD-2) screener. We used the sum of the person-level item scores to estimate total symptom severity. Estimates incorporate Census-provided weights for age, gender, education, race and non-response. Significance tests of bars are based on a weighted t-test; significance between bars is based on a z-test as described in (3). Numbers adjacent to bars indicate p-values.

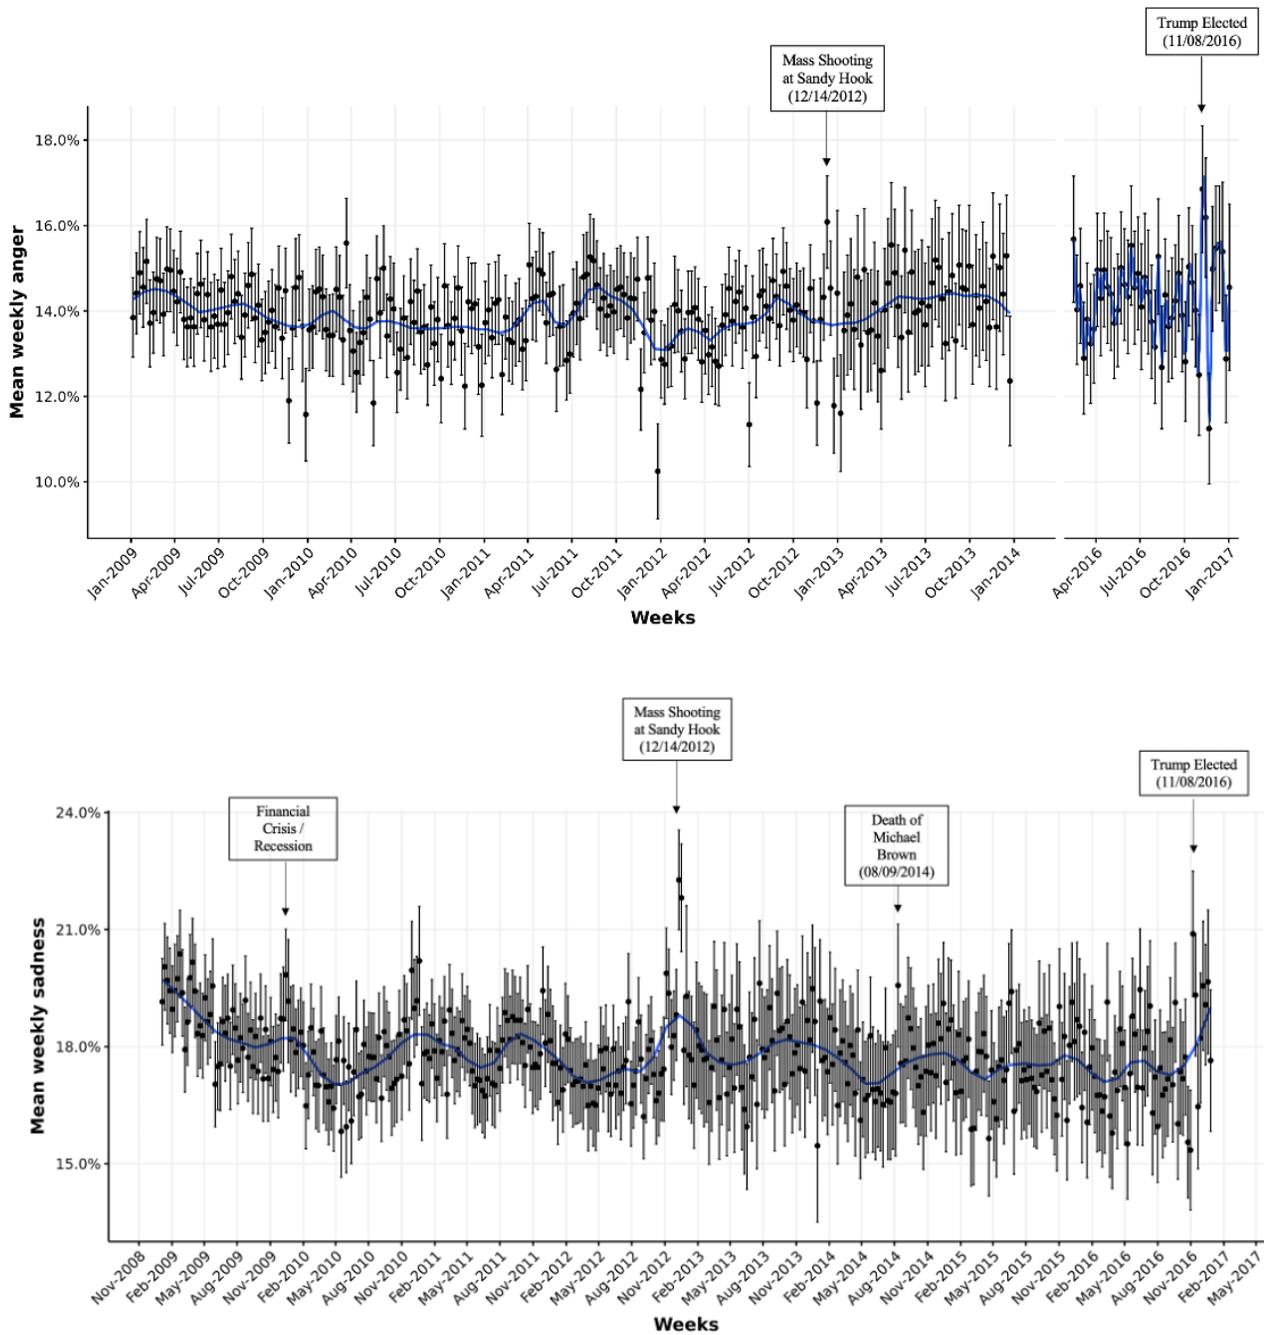

**Fig. S10. (Top):** Gallup Panel COVID-19 data set: Increases in sadness and anger reported in the week following Floyd's death compared to the four baseline weeks (analogous to **Fig. 1 c** and **d**). Increases in anger and sadness were significantly larger in Minnesota than in other states during the same period. **(Bottom):** U.S. Census Household Pulse Survey: Increases in anxiety and depression as standardized effect sizes (Cohen's *d*'s) during the week of Floyd's death as compared to the previous five-week baseline period using data from the Census Household Pulse survey (analogous to **Fig. 2**). While anxiety and depression symptom severity increased significantly ( $p$ 's < 0.001) nation-wide in response to Floyd's death, these increases were more pronounced in Minnesota. Numbers adjacent to bars indicate  $p$ -values.
